Sequence 1, Application US/08380160
Patent No. 6235284
GENERAL INFORMATION:
APPLICANT: DALBON, Pascal
APPLICANT: JOLIVET, Michel
TITLE OF INVENTION: SYNTHETIC POLYPEPTIDES BELONGING TO THE
TITLE OF INVENTION: FOR DETECTING THE LATTER
UNDRES OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: OLIFF & BERRIDGE
                                                                                                                                                                                                                                                      Sequence 1, Application US/09389756

Patent No. 6576240

GENERAL INFORMATION:
APPLICANT: JOLIVET, MICHEL
APPLICANT: DALBON, PASCAL
APPLICANT: LADAVIERE, LAURENT
APPLICANT: LADAVIERE, LAURENT
APPLICANT: LADAVIERE, LAURENT
APPLICANT: LADAVIERE, LAURENT
APPLICANT: LACOUX, XAVIER
TITLE OF INVENTION: ANTIGENIC STRUCTURAL PEPTIDE, ANTIGENIC AND IMMUNOGENI
TITLE OF INVENTION: ANTIGENIC STRUCTURAL PEPTIDE, ANTIGENIC AND IMMUNOGENI
TITLE OF INVENTION: ANTIGENIC STRUCTURAL PEPTIDE, ANTIGENIC AND IMMUNOGENI
TITLE OF INVENTION: TREATING AN HCV INFECTION
FILE REFERENCE: 103959
CURRENT FILING DATE: 1999-09-07

                  Sequence 77, Application US/09921397
Patent No. US20020151484A1
GENERAL INFORMATION:
APPLICANT: HYBRIGGEN
TITLE OF INVENTION: Dathogenic acids and polypeptides selected from TITLE OF INVENTION: pathogenic strain of the hepatitis C virus and TITLE OF INVENTION: applications thereof FILE REFERENCE: B4809A - JAZ
CURRENT APPLICATION NUMBER: US/09/921,397
CURRENT FILING DATE: 2000-08-02
PRIOR FILING DATE: 2000-08-03
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

(HCV) genomic RNA. The protein can be easily detected by antibodies in an assay for the detection of HCV. The DNA and the protein are useful for classifying the subtype of HCV. At least a part of the protein may be used as a vaccine against HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cDNA was prepared from HCV genomic RNA. Full-length clone JKI-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-A. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                              The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (RRAL). The mosalc protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme Sequences Asv06673-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a polypeptide comprising a 3023 amino acid sequence which is encoded by a cDNA (AAT13279) to a hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hepatitis C virus genomic RNA, DNA and related proteins - useful for detection, diagnosis and identification of hepatitis C virus sub-type

Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL; restriction endonuclease assisted ligation; vaccination.
                              CDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-C. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV. See AAQ40425-Q40439

                                                                                                                                                                                                                                                                                    cDNA was prepared from HCV genomic RNA. Full-length clone JK1-B (9405 nucleotides long) and 14 shorter clones were isolated by PCR amplification, including clone JK3-B. Primer/probes derived from the sequences of these clones can be used in diagnostic assays for HCV.

The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from uncleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein a laso useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, specitum of immunoreactivity, and antigen specificity of enzyme sequences AAV66673-681 represent amino acid sequence of each monomer comprising the NC mosaic protein.

Isolated CDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the CDNAs can be used in vaccines for immunishing against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, Lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection \,
                                                                                                                                                                                                             Hepatitis C virus isolate HK10 core protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus isolate S52 core protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (USSH ) US DEPT HEALTH & HUMAN SERVICES.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel attenuated flavivirus live vaccine comprising a flavivirus mutant that has a deletion of at least 4 consecutive anno acids from the capsid protein, provided that the consecutive anno acids from the capsid protein, provided that the consecutive annoal hydrophobic region is not affected by the deletion. The vaccine of the invention has virucide, antinflammatory and hepatotropic activity. The attenuated vaccine, and similar nucleic acid vaccines that encode the mutated capsid protein, are useful for protection against a wide range of flavivirus diseases, e.g. yellow fever. Japanese and concephalitis, dengue, classical swine fever, bovine viral diarrhoea and concephalitis C. The specified deletion: (i) produces a reliably attenuated virus that does not revert to virulence; (ii) is exactly defined and does: (c) the step in much responses to important proteins; and (ii) can not generate a non-natural virus by recombination. The mutant viruses eliminate the need to produce large amounts of infectious/virulent contracts and can be produced with less expense. The protective response continues, and can be produced with less expense. The protective response continues are presents a fragment of the capsid protein from Hepatitis

                                                              AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monounclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                         AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            envelope 1; core protein; HCV genotyping; antibody; vaccine;

The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from uncleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein a laso useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunozactivity, and antigen specificity of enzyme immunosassys. This provides improved detection of hepatitis C virus. Sequences AAV06673-681 sepresent amino acid sequence of each monomer comprising the NC mosaic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis C virus; subtype; polymerase chain reaction; amplification; PCR; primer; probe; antibody; infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences AAR96526-R96578 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-j, 5a and 6a. They esp. from the novel subtypes ld-f, 2e-i, 2k, 2l, 3g, 4k-m, 7a-c or types 9, 10 or 11. The sequences corresp. to the 5 unitranslated region (UR), the Core/El, NS4 or NS5B regions of the genome. This sequence represents amino acids 1-317 from the HCV types 7c and 8a isolates VN4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The new HCV types were isolated from patients with chronic HCV from the benelux countries. France, Cameroon and Vietnam, because of their aberiant reactivities. The RNA was extracted, cDNA synthesised and PCR amplified, cloned and genotyped. The YUR, Core/El and NS5B regions were ageinence either directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences were used to generate the peptides AAR96424-R96524. The aequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeptides can be used codetect anti-HCV antibodies, for HCV typing or to prevent HCV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mosaic protein; antigenic peptide; nucleocapsid; NC; hepatitis; REAL;

Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, sallva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 125; DB 17; Length 191;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                           The new HCV types were isolated from patients with chronic HCV from the Benelux countries, France, Cameroon and Vietnam, because of their Benelux countries, France, Cameroon and Vietnam, because of their aberrant reactivities. The RNA was extracted, cDNA synthesised and PCR amplified, cloned and genotyped. The 5'UR, Core/El and NS5B regions were sequenced atther directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences can also be used to generate the peptides ARP96424-R96524. The sequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeptides can be used to detect anti-HCV antibodies, for HCV typing or to prevent HCV infections.
                                              The sequences AAR96526-R96578 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes la-c, 2a-d, 3a-f, 4a-j, 5a and 6a. They esp. from the novel subtypes ld-f, 2e-i, 2k, 2l, 3g, 4k-m, 7a-c or types 9, 10 or 11. The sequences corresp. to the 5' untranslated region (UR), the Core/El, NS4 or NS5B regions of the genome. This sequence represents amino acids 1-74 from the HCV type lla isolate FR19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. Of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     envelope 1; core protein; HCV genotyping; antibody; vaccine,

RESULT 2 PC2060

Protone polyprotein N1 - hepatitis C virus
N; Contains: envelope protein E1; nonstructural protein E2/NS1
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Species: pepatitis C virus
S; Vitvitski, L.; Tong, S.P.; Trepo, C.
Blochem: Biophys. Res. Commun. 199, 1474-1481, 1994
A; Title: Identification of the third major genotype of hepatitis C virus in France
A; Reference number: PC2060; MUID: 94197744; PMID: 8147893
A; Accession: PC2060
A; Molecule type: mRNA
A; Residues: 1-411 - 6L1J>
C; Superfamily: hepatitis C virus genome polyprotein
C; Keywords: ATP; capabid protein; envelope protein; glycoprotein; nonstructural protein
E; 132-383/Product: envelope protein E1 #status predicted <NPE>
F; 196, 209, 234, 305, 325/Binding site: carbohydrate (Asn) (covalent) #status predicte

genome polyprotein N2 - hepatitis C virus
N;Contains: envelope protein E1; nonstructural protein E2/NS1
N;Contains: envelope protein E1; nonstructural protein E2/NS1
C;Species: hepatitis C virus
C;Species: 14-Jul-1994 #sequence_revision 14-Jul-1994 #text_change 17-Nov-2000
C;Accession: PC2061
R;Li, J.S.; Vitvitski, L.; Tong, S.P.; Trepo, C.
R;Li, J.S.; Vitvitski, L.; Tong, S.P.; Trepo, C.
A;Itle: Identification of the third major genotype of hepatitis C virus in France.
A;Reference number: PC2060; MUID:94197744; PMID:8147893
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               predicted

genome polyprotein - hepatitis C virus (strain JT)
N:Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nons
protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cispecies: hepatitis C virus
Cispecies: hepatitis C virus
Cispecies: 19-May-2000 #sequence_revision 19-May-2000 #text_change 19-Jan-2001
Cispecies: 10: A45573
Ritanaka, T.; Kato, N.; Nakagawa, M.; Ootsuyama, Y.; Cho, M.J.; Nakazawa, T.; Hijl Ritanaka, T.; Hijl Ritanaka, T.; Hijl Willes Res. 23, 39-53, 1992
A:Title: Molecular cloning of hepatitis C virus genome from a single Japanese carr A:Reference number: A45573; MUID:92295714; PMID:1318627
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

A Tanaka T., Fukuda S., Tsuda F., Mishiro S.;

Tology to reported isolates: comparative study of four distinct genotypes.";

Uirology 188:331-341(1992).

LI FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

STAND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

STAND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN BAND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CELLULAR AUMOPEPTIDASE.

Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2739(1992).
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRRA.

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MINA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEGUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (RNA)(N).
--- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MINA.
--- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
--- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.
--- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: NSSA SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE. FUNCTION: NSSB IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prince A.M.; "Genomic strain H of hepatitis "Genomic structure of the human prototype strain H of hepatitis virus: comparison with American and Japanese isolates."; Proc. Natl. Acad. Sci. U.S.A. 88:10292-10296(1991).

C -1- FUNCTION: THE SMALL PROFIEIDS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in Pl and Ser or Ala in Pl'
C -1- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
          01-A0G-1992 (Rel. 23, Created)
01-A0G-1992 (Rel. 23, Last sequence update)
01-A0G-1992 (Rel. 23, Last sequence update)
01-A0G-1992 (Rel. 41, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Bnvelope glycoprotein El (G922) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21) (EC 3.4.22.-); Proteases/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P4); Nonstructural protein NS5A (P65); Nonstructural protein NS5A (P66); P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J6) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (RNA)(N).
SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROPEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pro: IPR007095; RNA_pol_DS_PS.

-I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-I- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

PICC. NEALL PROTEINS NS2B, NS4B AND NS4B ARE

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE—RELATED FUNTION.

C. I- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6

DOSITION, Cys or Thr in P1 and Ser or Ala in P1.

C. I- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. "Genetic variability of hepartitis C virus in Western Siberia.";
"Genetic variability of hepartitis C virus in Western Siberia.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-!- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
LIPOPROTEIN WAND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
